Can a blood pressure medication help memory loss and Alzheimer’s disease?

Are you interested in volunteering for a study that tests if a blood pressure medication might help prevent memory loss and reduce the build-up of proteins in the brain that causes Alzheimer’s disease? Ask us about the CEDAR trial!

Eligible participants:
- 50 years and older with memory difficulties
- NOT hypertensive
- willing to undergo a memory evaluation, lumbar puncture and take an FDA-approved blood pressure medication
- Not in an other study with brain assessments or medications

What is included in this study?
- Free Brain scans, non-invasive evaluation of their arteries, blood draws, and blood pressure measurements
- Compensation for time and travel
